

Tito Perdana, Senior Geologist

Tito began his career at Schlumberger as a Borehole Geologist, focusing on borehole image log interpretation to characterize fractures and faults, determine *in-situ* stress orientations, optimize completions, identify sedimentary features and textures, and develop multi-scale structural interpretations, working in Kuwait, Canada and the California Basin. Since joining GeothermEx, he has readily adapted these skills to the hard-rock, fractured geothermal environment, and has expanded his repertoire to include assessment of geothermal exploration data, structural analysis, conceptual model development, capacity estimation, and well placement optimization.
